# Lecture 10: Doubly Linked Lists

- ▶ Doubly Linked Lists
- ▶ Java Collections

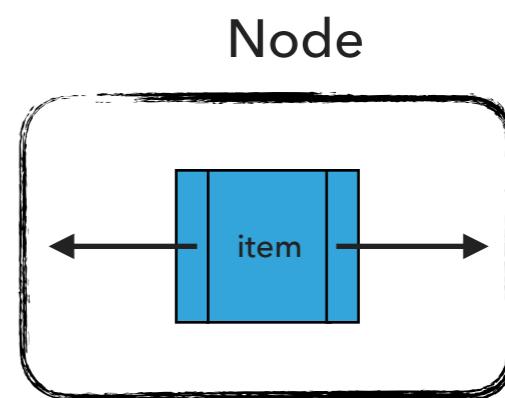

## Recursive Definition of Doubly Linked Lists

- ▶ A doubly linked list is either empty (null) or a **node** having a reference to a doubly linked list.
- ▶ **Node**: is a data type that holds any kind of data and two references to the previous and next node.

## Node

```
private class Node {  
    Item item;  
    Node next;  
    Node prev;  
}
```

## Standard Operations

- ▶ `DoublyLinkedList()`: Constructs an empty doubly linked list.
- ▶ `isEmpty()`: Returns true if the doubly linked list does not contain any item.
- ▶ `size()`: Returns the number of items in the doubly linked list.
- ▶ `get(int index)`: Returns the item at the specified index.
- ▶ `addFirst(Item item)`: Inserts the specified item at the head of the doubly linked list.
- ▶ `addLast(Item item)`: Inserts the specified item at the tail of the doubly linked list.
- ▶ `add(int index, Item item)`: Inserts the specified item at the specified index.
- ▶ `Item removeFirst()`: Retrieves and removes the head of the doubly linked list.
- ▶ `Item removeLast()`: Retrieves and removes the tail of the doubly linked list.
- ▶ `Item remove(int index)`: Retrieves and removes the item at the specified index.

## DoublyLinkedList(): Constructs an empty DLL

```
DoublyLinkedList<String> dll = new DoublyLinkedList<String>();
```

head = null

tail = null

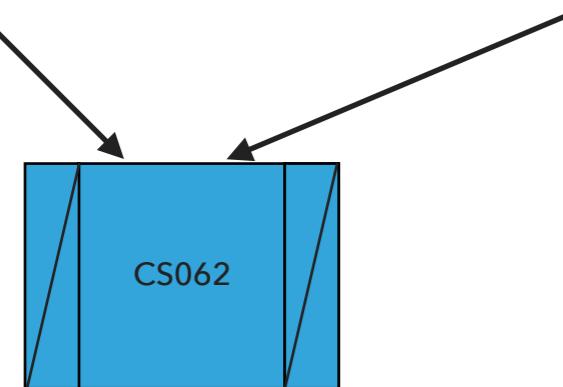

n = 0

What should happen?

dll.addFirst("CS062");

`addFirst(Item item)`: Inserts the specified item at the head of the doubly linked list

Head/Beginning/Front/First      Tail/End/Back/Last

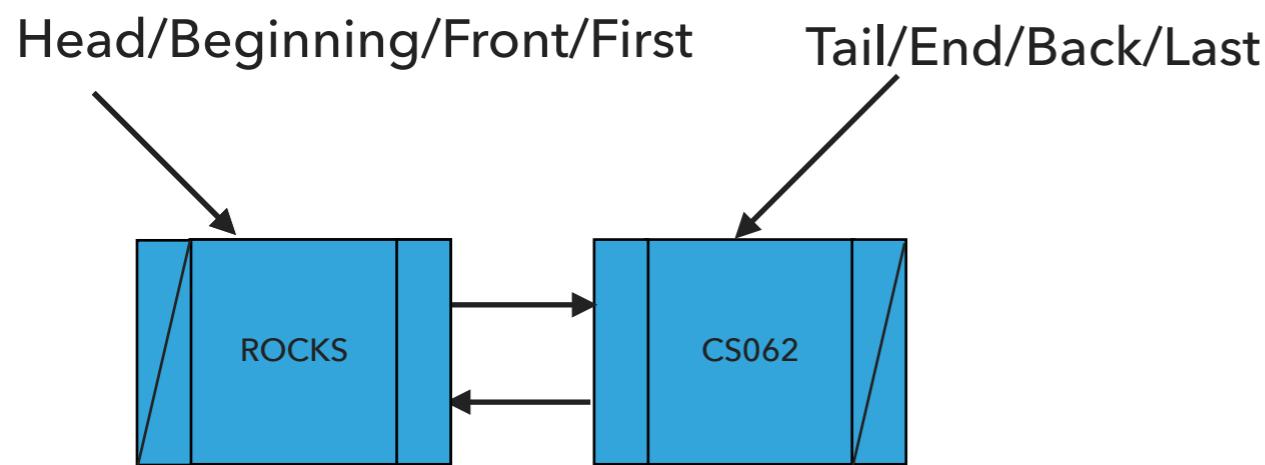

`dll.addFirst("CS062")`  
 $n=1$

What should happen?

`dll.addFirst("ROCKS");`

`addFirst(Item item)`: Inserts the specified item at the head of the doubly linked list

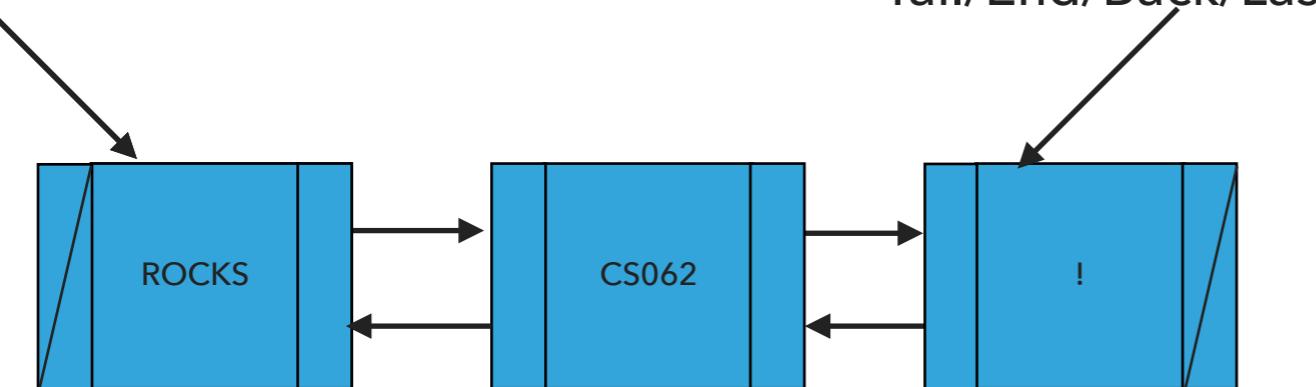

`dll.addFirst("ROCKS")`  
 $n=2$

What should happen?

`dll.addLast("!");`

`addLast(Item item)`: Inserts the specified item at the tail of the doubly linked list

Head/Beginning/Front/First

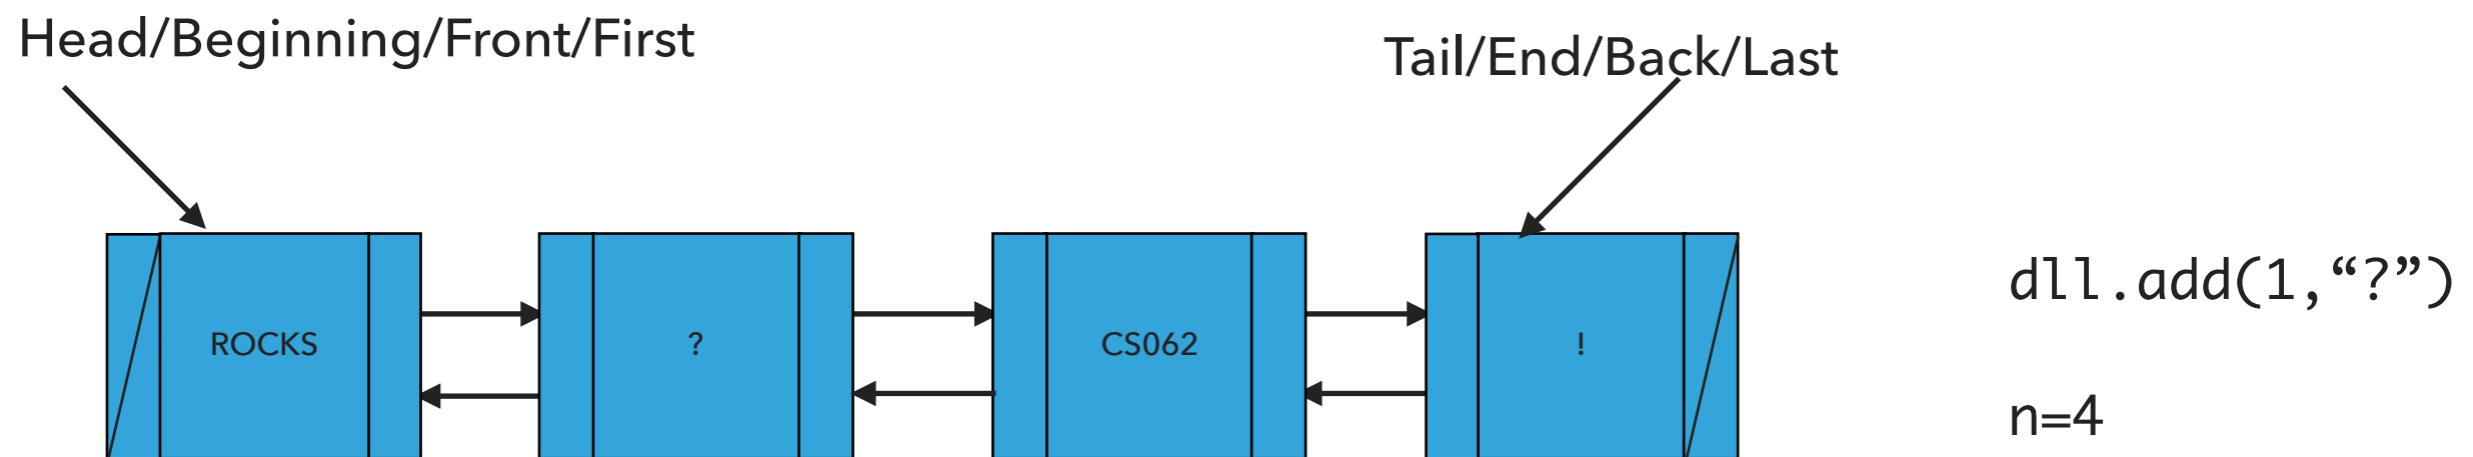

Tail/End/Back/Last

`dll.addLast("!")`  
n=3

What should happen?

`dll.add(1,"?");`

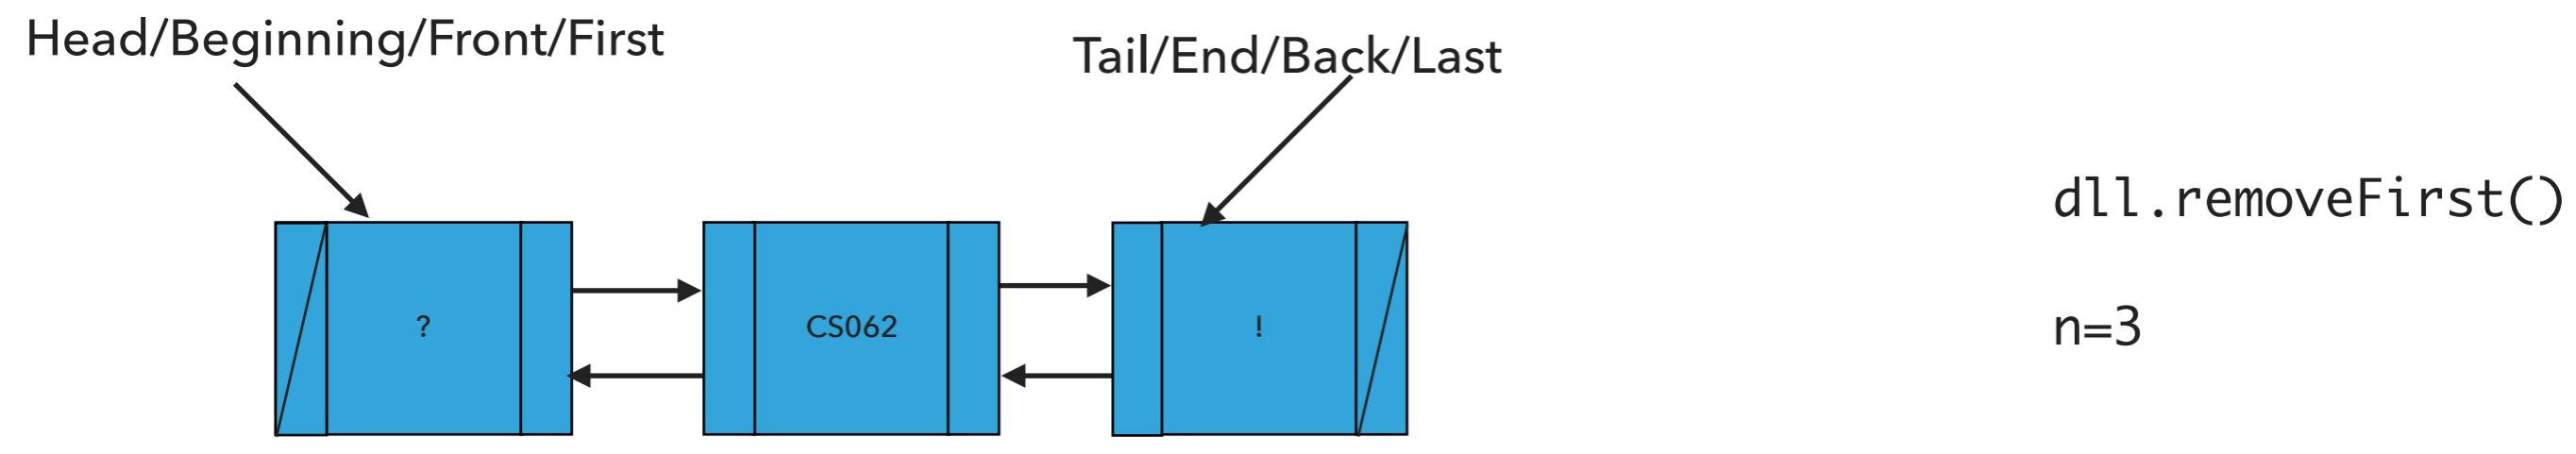

`add(int index, Item item)`: Adds item at the specified index

What should happen?

`dll.removeFirst();`

`removeFirst()`: Retrieves and removes the head of the doubly linked list

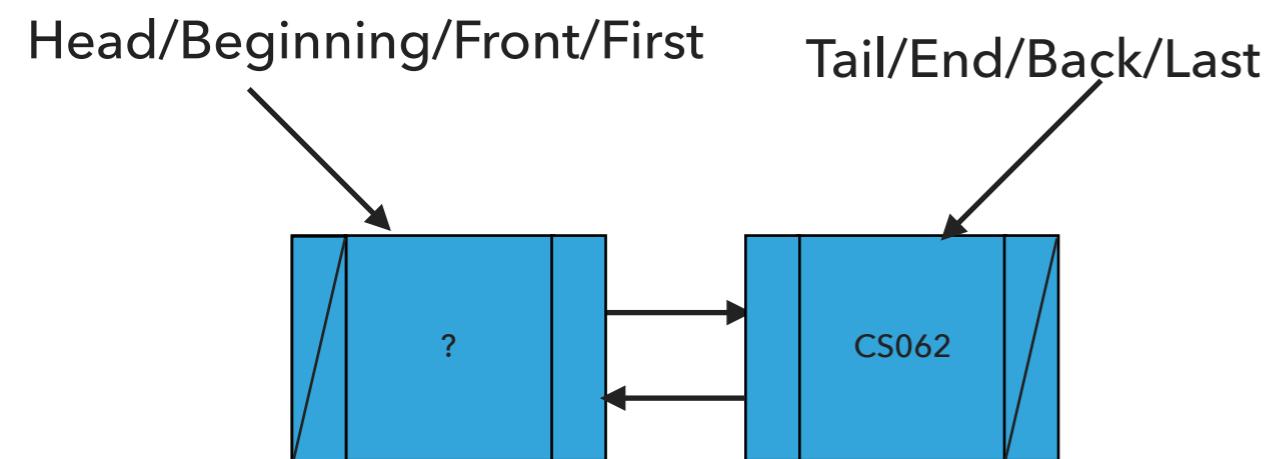

`dll.removeFirst()`  
 $n=3$

What should happen?

`dll.removeLast();`

`removeLast()`: Retrieves and removes the tail of the doubly linked list

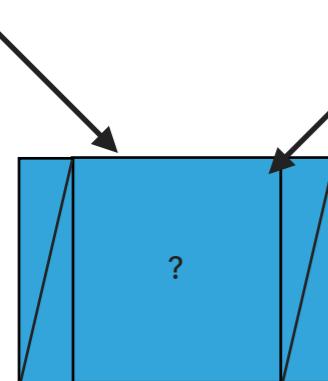

`dll.removeLast()`  
 $n=2$

What should happen?

`dll.remove(1);`

`remove(int index)`: Retrieves and removes the item at the specified index

Head/Beginning/Front/First

Tail/End/Back/Last

`dll.remove(1)`

$n=1$

## Our own implementation of Doubly Linked Lists

- ▶ We will follow the textbook style.
  - ▶ It does not offer a class for this so we will build our own.
- ▶ We will work with generics because we don't want to offer multiple implementations.
- ▶ We will use an inner class Node and we will keep track of how many elements we have in our doubly linked list.

## Instance variables and inner class

```
public class DoublyLinkedList<Item> implements Iterable<Item> {  
    private Node first; // head of the doubly linked list  
    private Node last; // tail of the doubly linked list  
    private int n; // number of nodes in the doubly linked list  
  
    /**  
     * This nested class defines the nodes in the doubly linked list with a value  
     * and pointers to the previous and next node they are connected.  
     */  
    private class Node {  
        Item item;  
        Node next;  
        Node prev;  
    }  
}
```

## Check if is empty and how many items

```
/**  
 * Returns true if the doubly linked list does not contain any item.  
 *  
 * @return true if the doubly linked list does not contain any item  
 */  
public boolean isEmpty() {  
    return size() == 0;  
}  
  
/**  
 * Returns the number of items in the doubly linked list.  
 *  
 * @return the number of items in the doubly linked list  
 */  
public int size() {  
    return n;  
}
```

## Retrieve item from specified index

```
/**  
 * Returns item at the specified index.  
 *  
 * @param index  
 *          the index of the item to be returned  
 * @return the item at specified index  
 */  
public Item get(int index) {  
    rangeCheck(index);  
  
    if (index == 0)  
        return first.item;  
  
    else if (index == size() - 1)  
        return last.item;  
  
    Node finger = first;  
    // search for index-th element or end of list  
    while (index > 0) {  
        finger = finger.next;  
        index--;  
    }  
    return finger.item;  
}
```

# Insert item at head of doubly linked list

```
/**  
 * Inserts the specified item at the head of the doubly linked list.  
 *  
 * @param item  
 *         the item to be inserted  
 */  
public void addFirst(Item item) {  
    // Save the old node  
    Node oldfirst = first;  
  
    // Make a new node and assign it to head. Fix pointers.  
    first = new Node();  
    first.item = item;  
    first.next = oldfirst;  
    first.prev = null;  
  
    // if first node to be added, adjust tail to it.  
    if (last == null)  
        last = first;  
    else  
        oldfirst.prev = first;  
  
    n++; // increase number of nodes in doubly linked list.  
}
```

# Insert item at tail of doubly linked list

```
/**  
 * Inserts the specified item at the tail of the doubly linked list.  
 *  
 * @param item  
 *         the item to be inserted  
 */  
public void addLast(Item item) {  
    // Save the old node  
    Node oldlast = last;  
  
    // Make a new node and assign it to tail. Fix pointers.  
    last = new Node();  
    last.item = item;  
    last.next = null;  
    last.prev = oldlast;  
  
    // if first node to be added, adjust head to it.  
    if (first == null)  
        first = last;  
    else  
        oldlast.next = last;  
  
    n++;  
}
```

## Check if index is $\geq 0$ and $< n$

```
/**  
 * A helper method to check if an index is in range 0<=index<n  
 *  
 * @param index  
 *         the index to check  
 */  
private void rangeCheck(int index) {  
    if (index > n || index < 0)  
        throw new IndexOutOfBoundsException("Index " + index + " out of bounds");  
}
```

# Insert item at a specified index

```
/*
 * Inserts the specified item at the specified index.
 *
 * @param index
 *         the index to insert the item
 * @param item
 *         the item to insert
 */
public void add(int index, Item item) {
    rangeCheck(index);

    if (index == 0) {
        addFirst(item);
    } else if (index == size()) {
        addLast(item);
    } else {

        Node previous = null;
        Node finger = first;
        // search for index-th position
        while (index > 0) {
            previous = finger;
            finger = finger.next;
            index--;
        }
        // create new value to insert in correct position
        Node current = new Node();
        current.item = item;
        current.next = finger;
        current.prev = previous;
        previous.next = current;
        finger.prev = current;

        n++;
    }
}
```

## Retrieve and remove head

```
/**  
 * Retrieves and removes the head of the doubly linked list.  
 *  
 * @return the head of the doubly linked list.  
 */  
public Item removeFirst() {  
    Node oldFirst = first;  
    // Fix pointers.  
    first = first.next;  
    // at least 1 nodes left.  
    if (first != null) {  
        first.prev = null;  
    } else {  
        last = null; // remove final node.  
    }  
    oldFirst.next = null;  
  
    n--;  
  
    return oldFirst.item;  
}
```

## Retrieve and remove tail

```
/**  
 * Retrieves and removes the tail of the doubly linked list.  
 *  
 * @return the tail of the doubly linked list.  
 */  
public Item removeLast() {  
  
    Node temp = last;  
    last = last.prev;  
  
    // if there was only one node in the doubly linked list.  
    if (last == null) {  
        first = null;  
    } else {  
        last.next = null;  
    }  
    n--;  
    return temp.item;  
}
```

# Retrieve and remove element from a specific index

```
/*
 * Retrieves and removes the item at the specified index.
 *
 * @param index
 *      the index of the item to be removed
 * @return the item previously at the specified index
 */
public Item remove(int index) {
    rangeCheck(index);

    if (index == 0) {
        return removeFirst();
    } else if (index == size() - 1) {
        return removeLast();
    } else {
        Node previous = null;
        Node finger = first;
        // search for value indexed, keep track of previous
        while (index > 0) {
            previous = finger;
            finger = finger.next;
            index--;
        }
        previous.next = finger.next;
        finger.next.prev = previous;

        n--;
        // finger's value is old value, return it
        return finger.item;
    }
}
```
